AB The present disclosure invention relates to medical devices treated with a solution comprising 1 or more solvents and a combination of **chlorhexidine** free base and a **water**-soluble **chlorhexidine** salt in a weight/weight ratio of 1:1-1:5, preferably 1:1. Thus, the drug levels of polyurethane **catheters** treated with **chlorhexidine** acetate-**chlorhexidine** (CHA) and Ag sulfadiazine (AgSD) had a significantly higher drug retention under either testing method than **catheters** treated with similar drug levels of CHA alone with AgSD.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention relates to **antimicrobial** compositions, methods for the production of these compositions, and use of these compositions with medical devices, such as **catheters**, and implants. The compositions of the present invention advantageously provide varying release kinetics for the active ions in the compositions due to the different **water** solubilities of the ions, allowing **antimicrobial** release profiles to be tailored for a given application and providing for sustained **antimicrobial** activity over time. More particularly, the invention relates to **polymer** compositions containing colloids comprised of salts of one or more oligodynamic metal, such as silver. The process of the invention includes mixing a solution of one or more oligodynamic metal salts with a **polymer** solution or dispersion and precipitating a colloid of the salts by addition of other salts to the solution which react with some or all of the first metal salts. The compositions can be incorporated into articles or can be employed as a coating on articles such as medical devices. Coatings may be on all or part of a surface.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides for **antimicrobial** medical articles prepared by a method comprising treating a surface of the medical article with a solution consisting essentially of one or more solvents and a mixture of **chlorhexidine** free base and a **water**-soluble **chlorhexidine** salt, at a weight/weight ratio of between about 1:1 to about 1:5, wherein the combined concentration of **chlorhexidine** free base and a **water**-soluble salt of **chlorhexidine** is about 2% (w/v) or greater. In alternative embodiments, the **antimicrobial** medical articles may be treated with a similar solution in which the concentrations of **chlorhexidine** free base and a **water**-soluble salt of **chlorhexidine** are each about 0.20 percent (w/v). Other embodiments include those in which the **solvent** comprises methanol, or the treatment solution further comprises a silver salt, one or more organic acids, an **anti-inflammatory** agent, and a hydrogel.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L6 ANSWER 5 OF 25 USPATFULL on STN

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The invention is drawn to silane copolymers prepared from the reaction of one or more polyisocyanates with one or more lubricious **polymers** having at least two functional groups, which may be the same or different, that are reactive with an isocyanate functional group and with one or more organo-functional silanes having at least two functional groups, which may be the same or different, that are reactive with an isocyanate functional group and at least one functional group reactive with a silicone rubber substrate. The silane copolymers of the invention can be used as coatings that are elastic when dry, lubricious when wet, and resist wet abrasion. These copolymers are useful as coatings for polysiloxane (rubber) and other difficult to coat substrates, especially for medical devices, such as **catheters**. These silane copolymers can contain active agents such as **antimicrobials**, pharmaceuticals, herbicides, insecticides, algacides, antifoulants, and antifogging agents.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A crosslinkable macromer system and related methods of preparing the system and using the system in the form of a crosslinked matrix between a tissue site and an implant article such as a tissue implant or on the porous surface of a prosthetic device. The macromer system includes two or more **polymer**-pendent **polymerizable** groups and one or more initiator groups (e.g., **polymer**-pendent initiator groups). The **polymerizable** groups and the initiator group(s), when **polymer**-pendent, can be pendent on the same or different **polymeric** backbones. The macromer system provides advantages over the use of **polymerizable** macromers and separate, low molecular weight initiators, including advantages with respect to such properties as nontoxicity, efficiency, and solubility. A macromer system of the invention can be used as an interface between the tissue site and implant article in a manner sufficient to permit tissue growth through the crosslinked matrix and between the tissue site and implant. In a preferred embodiment, **polymers** with pendent **polymerizable** groups, for use in the macromer system, are prepared by reacting a polysaccharide **polymer** with a reactive moiety in an organic, polar **solvent** such as formamide.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A coating composition, in both its uncrosslinked and crosslinked forms, for use in delivering a medicament from the surface of a medical device positioned in vivo. Once crosslinked, the coating composition provides a gel matrix adapted to contain the medicament in a form that permits the medicament to be released from the matrix in a prolonged, controlled, predictable and effective manner in vivo. A composition includes a polyether monomer, such as an alkoxy poly(alkylene glycol), a carboxylic acid-containing monomer, such as (meth)acrylic acid, a photoderivatized monomer, and a hydrophilic monomer such as acrylamide.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

LINE COUNT: 1571

AB The present invention relates to **polymeric** medical articles comprising combinations of triclosan and silver-containing compounds. It is based, at least in part, on the discovery that these agents act synergistically, thereby permitting the use of relatively low levels of both agents. While it had been previously found that triclosan can be particularly useful when used in conjunction with **chlorhexidine**, it has been further discovered that medical articles having suitable **antimicrobial** properties may be prepared, according to the present invention, which contain triclosan without **chlorhexidine**. Such medical articles offer the advantage of preventing or inhibiting infection while avoiding undesirable adverse reactions to **chlorhexidine** by individuals that may have sensitivity to **chlorhexidine**.

AB Described is a moisture-vapor-permeable and oxygen-permeable adhesive dressing for use in supplying a topical medicament to human skin in a controlled release manner, which dressing is unaffected by and impermeable to **water** in the liquid phase, which dressing when in use on human skin consists essentially of:

(i) a **polymeric** backing material lamina having two surfaces, a first substantially planar surface and a second substantially planar surface;

(ii) adhering to said first planar surface of said backing material a medication reservoir lamina having two surfaces, a first substantially planar surface and a second substantially planar surface, consisting essentially of an intimate mixture of:

(a) a polyvinyl chloride **polymer**;

(b) a **polymeric** plasticizer intimately admixed with said polyvinyl chloride and compatible with said polyvinyl chloride; and

(c) a topical medicament compatible with said polyvinyl chloride and said plasticizer;

said first substantially planar surface of said medication reservoir lamina adhering to said first substantially planar surface of said backing material in a continuous or discontinuous manner; and

(iii) adhering to said second substantially planar surface of said medication reservoir lamina, a pressure-sensitive adhesive which is permeable to oxygen and moisture vapor but is unaffected by liquid **water**.
